

Clarification Request

References: BTL Functionality Checklist “Uses static router address configuration”

Background / Proposed Solution:

There is a BTL Checklist lineitem and footnote:

	N ¹	Uses static router address configuration
¹ At least one of these options must be supported if the device is capable of transmitting unicast service requests other than COV notifications, <i>including unicast service requests containing remote or global broadcasts.</i>		

Question:

Should the Listing column for “Uses static router address configuration” indicate N as shown above using ~~strike through~~ and *italics*, for Not recommended? The BTL recommends against IUTs implementing this option due to possible interoperability or performance problems related with the option.

Should the footnote add the additional conditional language as shown above?

Response:

BTL-WG will adopt the suggested change, along with the necessary changes in the checklist. It will be accompanied by a corresponding change request to the SSPC.
