

Clarification Request

References: section 12.11.15 Protocol_Object_Types_Supported

Background:

EPICS Consistency 135.1-2003 5.(g): Object type File is listed in the "Standard Object Types Supported" section but no Objects of that type are defined in the test database; is reported for a device that contains File objects only during Backup & Restore. Should it clear the bit in Protocol_Object_Types_Supported and remove File from the "Standard Object Types Supported" section? Should the Consistency check be relaxed?

Response:

Do not clear the bit in Protocol_Object_Types_Supported. The Consistency check should be relaxed for the File object.
