

Clarification Request

References: BTL Specified Tests 5.0.final

Background / Proposed Solution:

The test **BTL 7.3.2.23.X1.3 Revision 4 Event Priority**, and other schedule object tests verify that the Schedule object's Priority_For_Writing is used within the WriteProperty requests that the Schedule object generates.

Question:

Where the target property is a standard property for which commandability is not an option, is the IUT allowed to leave out the Priority parameter from the WriteProperty request?

Response:

We will append to Notes to Tester: "..., or if the target property is a standard property of a standard object for which commandability is not an option." We will do this for all tests which refer to the Schedule object's Priority_For_Writing property.
