

## Clarification Request

**References:** BTL Specified Tests 14.X.2.2 **Initiating An Original-Unicast-NPDU**

**Stage:** Request, Listed, Analysis, Resolved

### Background / Proposed Solution:

The term "initiate" has been used pretty consistently in our documents to mean initiate. Except in checklist items "Is able to initiate unicasts" and "Is able to initiate broadcasts" where the test is actually responsive. The test "issues" or "transmits" a responsive unicast.

Can we please stop confusing the customers, by renaming the checklist items to "Is able to issue unicasts" and "Is able to issue broadcasts" and changing the name of BTL Specified Tests 14.X.2.2 to Issues An Original-Unicast-NPDU? The word "issue" is what is used in the prose.

### Response:

The issuance of unicasts is actually not optional, so the entire checklist item "Is able to issue unicasts" should be removed. The testable point is covered in other tests, so there is no need to keep BTL Specified Test 14.X.2.2 Initiates An Original-Unicast-NPDU in the Test Plan. The other testable point is more accurately described as: Initiates An Original-Broadcast-NPDU, and the "Is able to initiate broadcasts" section will be renamed "Is able to initiate Original-Broadcast-NPDU".
