

## **Clarification Request**

**References:** BTL Test Plan 135.1 - 2007 - 9.8.2.

### **Background:**

In test 9.8.2, the Test Concept is: A GetEventInformation-Request returns a GetEventInformation-ACK with exactly one entry in the 'List of Event Summaries'.

### **Question:**

Should an Event Enrollment object be reported in a List of Event Summaries more than once? What about if an object is both OFFNORMAL and FAULT? What about after a proprietary event-type Notification, which can indicate the object is in a proprietary Event\_State?

### **Response:**

No object should be reported in a List of Event Summaries more than once. If an Event Enrollment object has been reconfigured, then its prior generated events are no longer in the List of Event Summaries. If an object is in both OFFNORMAL and FAULT, it will still be in only one Event\_State; FAULT trumps OFFNORMAL.
